Subject: Push from the NSI to eG

I checked with David and the status is as follows

Each Federated Search set up in a FC has two check off boxes. One for the Federated Search (Shared Space) and one for eG. The fusion center does the vetting (due diligences of quality and privacy) and then decides to:

1. Not share it
2. Share it with the Federated Search via their common box
3. Share it with eG (requires the sharing with Federated Search as a prerequisite.

This places the decision with the FC as independent governmental agencies.

This has been in place for some time and some FC like Chicago have elected to always send to both and others because of privacy issue have decided to only send to their common box where they control the sharing.

We can add a provision that has send to both automatically but I would not make that the only option. This addition could be done by 8/31/11

The other issue is the holding bin which switches the decision to the JTTF.

Let me know if you have any questions.
