June 5, 2012

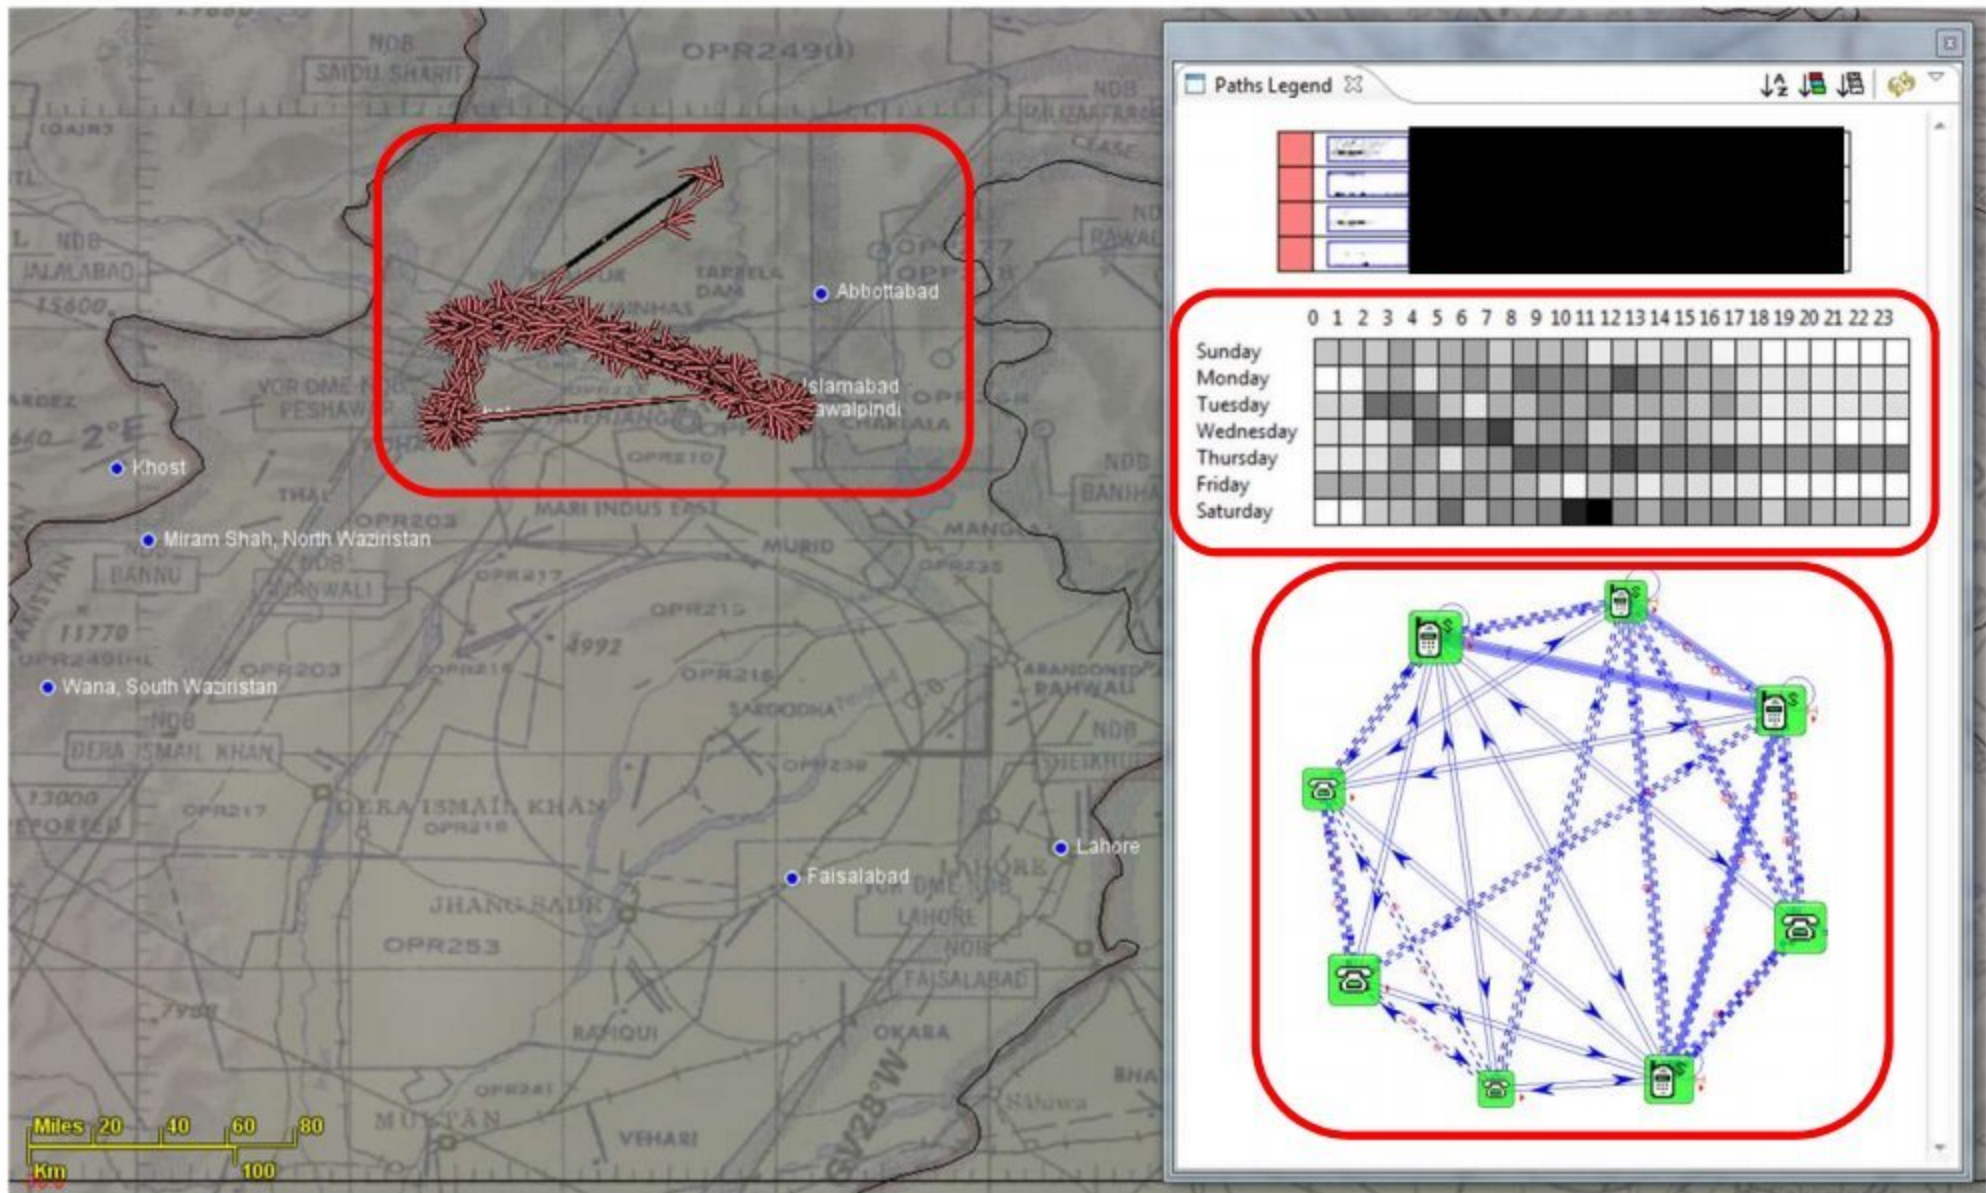

# Given a handful of courier selectors, can we find others that “behave similarly” by analyzing GSM metadata?

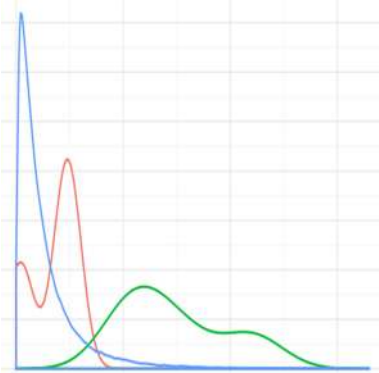

# From GSM metadata, we can measure aspects of each selector's **pattern-of-life**, **social network**, and **travel behavior**

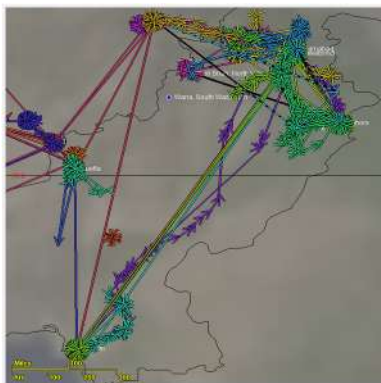

# This presentation describes our search for AQSL couriers using behavioral profiling

Behavioral Feature Extraction

Cross Validation Experiment on AQSL Couriers

Preliminary SIGINT Findings

# Counting unique UCELLIDs shows that couriers travel more often than typical Pakistani selectors

# By examining multiple features at once, we can see some indicative behaviors of our courier selectors

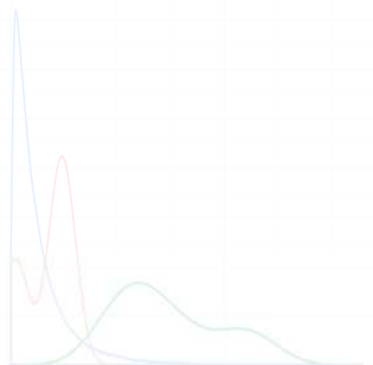

# Looking at a hierarchical clustering derived from all 80 features, the AQSL groups mostly stay together

# Now, we'll describe a cross validation experiment on the AQSL selectors that we were provided

Behavioral Feature Extraction

Cross Validation Experiment on AQSL Couriers

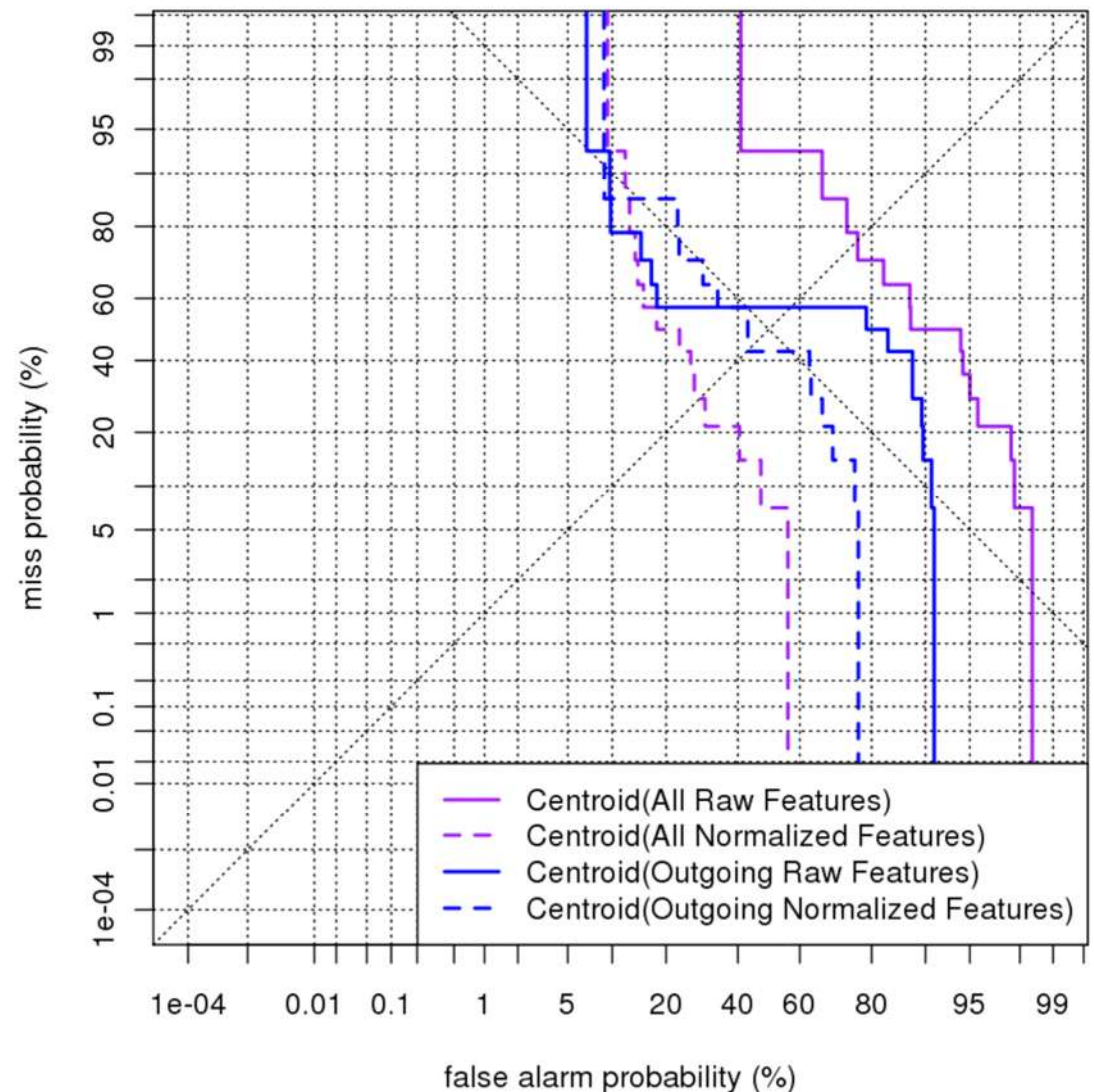

Preliminary SIGINT Findings

# Our initial detector uses the centroid of the AQSL couriers to “find other selectors like these”

## AQSL Cross-Validation Experiment

- 7 MSISDN/IMSI pairs
- Hold each pair out and score them when training the centroid on the rest
- Assume that random draws of Pakistani selectors are nontargets
- How well do we do?

# Our initial detector uses the centroid of the AQSL couriers to “find other selectors like these”

## AQSL Cross-Validation Experiment

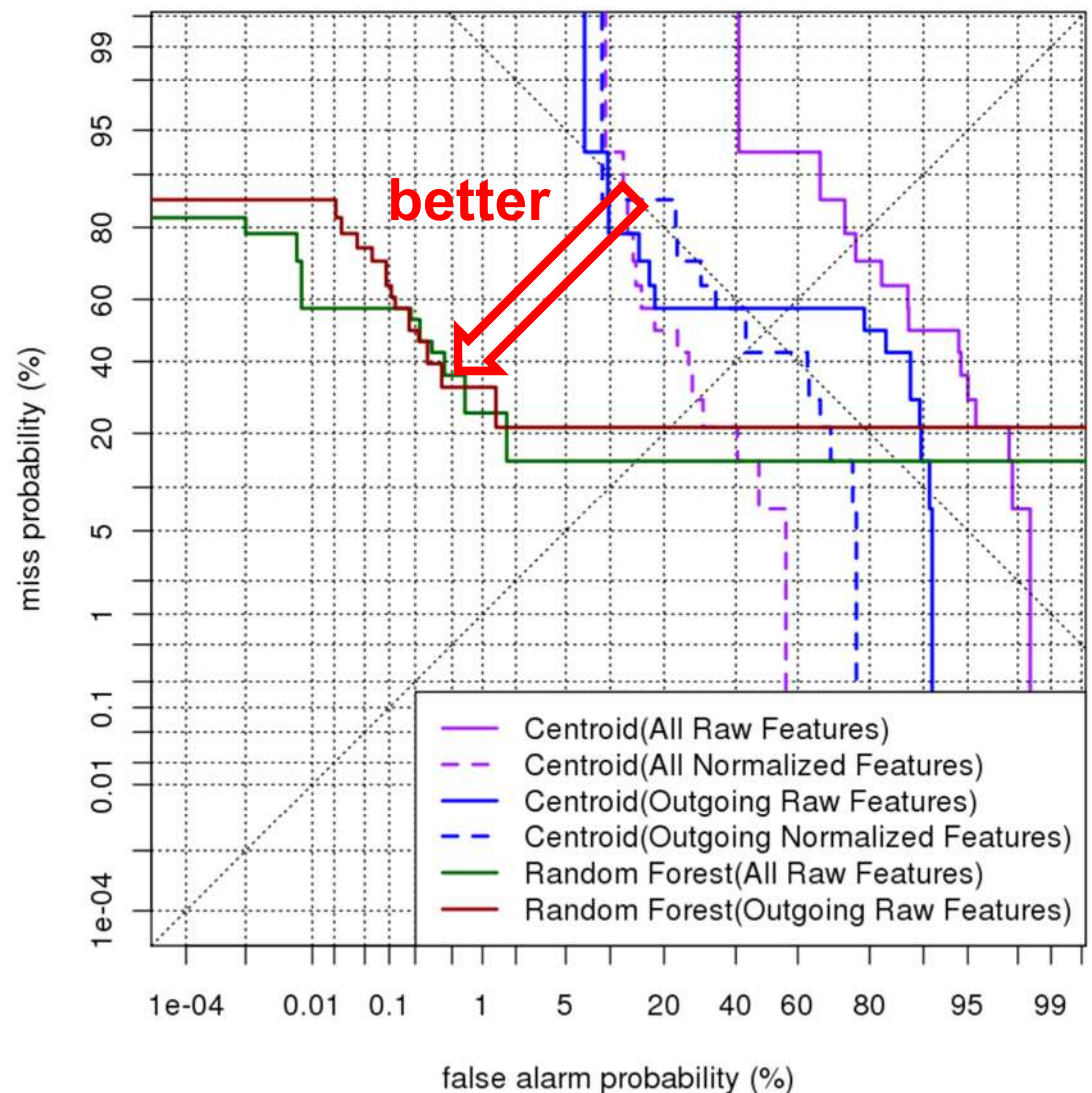

- Initial experiments showed EER in 10-20% range
- Here, performance is much worse against these nontargets:
  - Seen in Pakistan
  - Not seen outside of Af/Pak
  - Not FVEY selectors

**Statistical algorithms are able to find the couriers at very low false alarm rates, if we're allowed to miss half of them**

## Random Forest Classifier

- 7 MSISDN/IMSI pairs
- Hold each pair out and then try to find them after learning how to distinguish remaining couriers from other Pakistanis  
(using 100k random selectors here)
- Assume that random draws of Pakistani selectors are nontargets
- 0.18% False Alarm Rate at 50% Miss Rate

# We've been experimenting with several error metrics on both small and large test sets

Training Data	Classifier	Features	100k Test Selectors		55M Test Selectors	
			False Alarm Rate at 50% Miss Rate	Mean Reciprocal Rank	Tasked Selectors in Top 500	Tasked Selectors in Top 100
None	Random	None	50%	1/23k (simulated)	0.64 (active/Pak)	0.13 (active/Pak)
Known Couriers	Centroid	All	20%	1/18k		
		Outgoing	43%	1/27k		
+ Anchory Selectors	Random Forest		0.18%	1/9.9	5	1

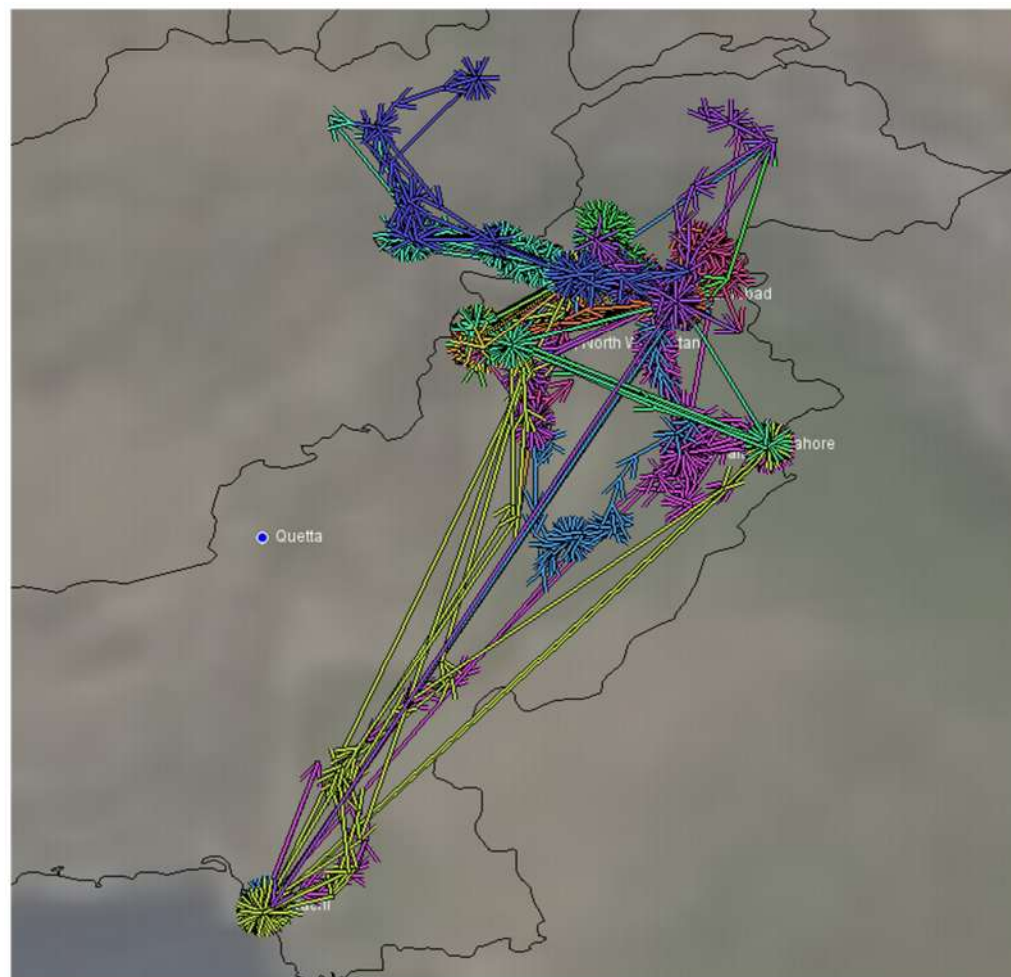

## Random Forest:

- 0.18% false alarm rate at 50% miss rate
- 7x improvement over random performance when evaluating its tasked precision at 100

# To get more training data we scraped selectors from S2I11 Anchory reports containing keyword “courier”

## Anchory Selectors

- Searched for reports containing “S2I11” AND “courier”
- Filtered out non-mobile numbers and kept selectors with “interesting” travel patterns seen in SmartTracker

# Adding selectors from Anchory reports to the training data reduced the false alarm rates even further

## Anchory Selectors

- Searched for reports containing “S2I11” AND “courier”
- Filtered out non-mobile numbers and kept selectors with “interesting” travel patterns seen in SmartTracker

# We've been experimenting with several error metrics on both small and large test sets

Training Data	Classifier	Features	100k Test Selectors		55M Test Selectors	
			False Alarm Rate at 50% Miss Rate	Mean Reciprocal Rank	Tasked Selectors in Top 500	Tasked Selectors in Top 100
None	Random	None	50%	1/23k (simulated)	0.64 (active/Pak)	0.13 (active/Pak)
Known Couriers	Centroid	All	20%	1/18k		
		Outgoing	43%	1/27k		
+ Anchory Selectors	Random Forest		Outgoing	0.18%	1/9.9	5
		0.008%		1/14	21	6

Random Forest trained on Known Couriers + Anchory Selectors:

- 0.008% false alarm rate at 50% miss rate
- 46x improvement over random performance when evaluating its tasked precision at 100

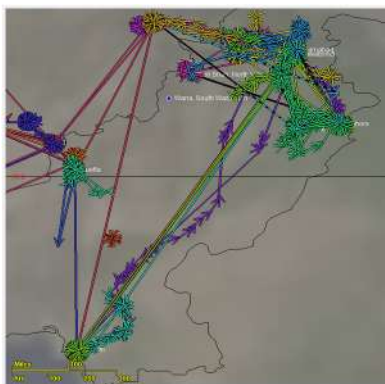

# Now, we'll investigate some findings after running these classifiers on +55M Pakistani selectors via MapReduce

Behavioral Feature Extraction

Cross Validation Experiment on AQSL Couriers

Preliminary SIGINT Findings

# The highest scoring selector that traveled to Peshawar and Lahore is **PROB AHMED Z Aidan**

Paths Legend

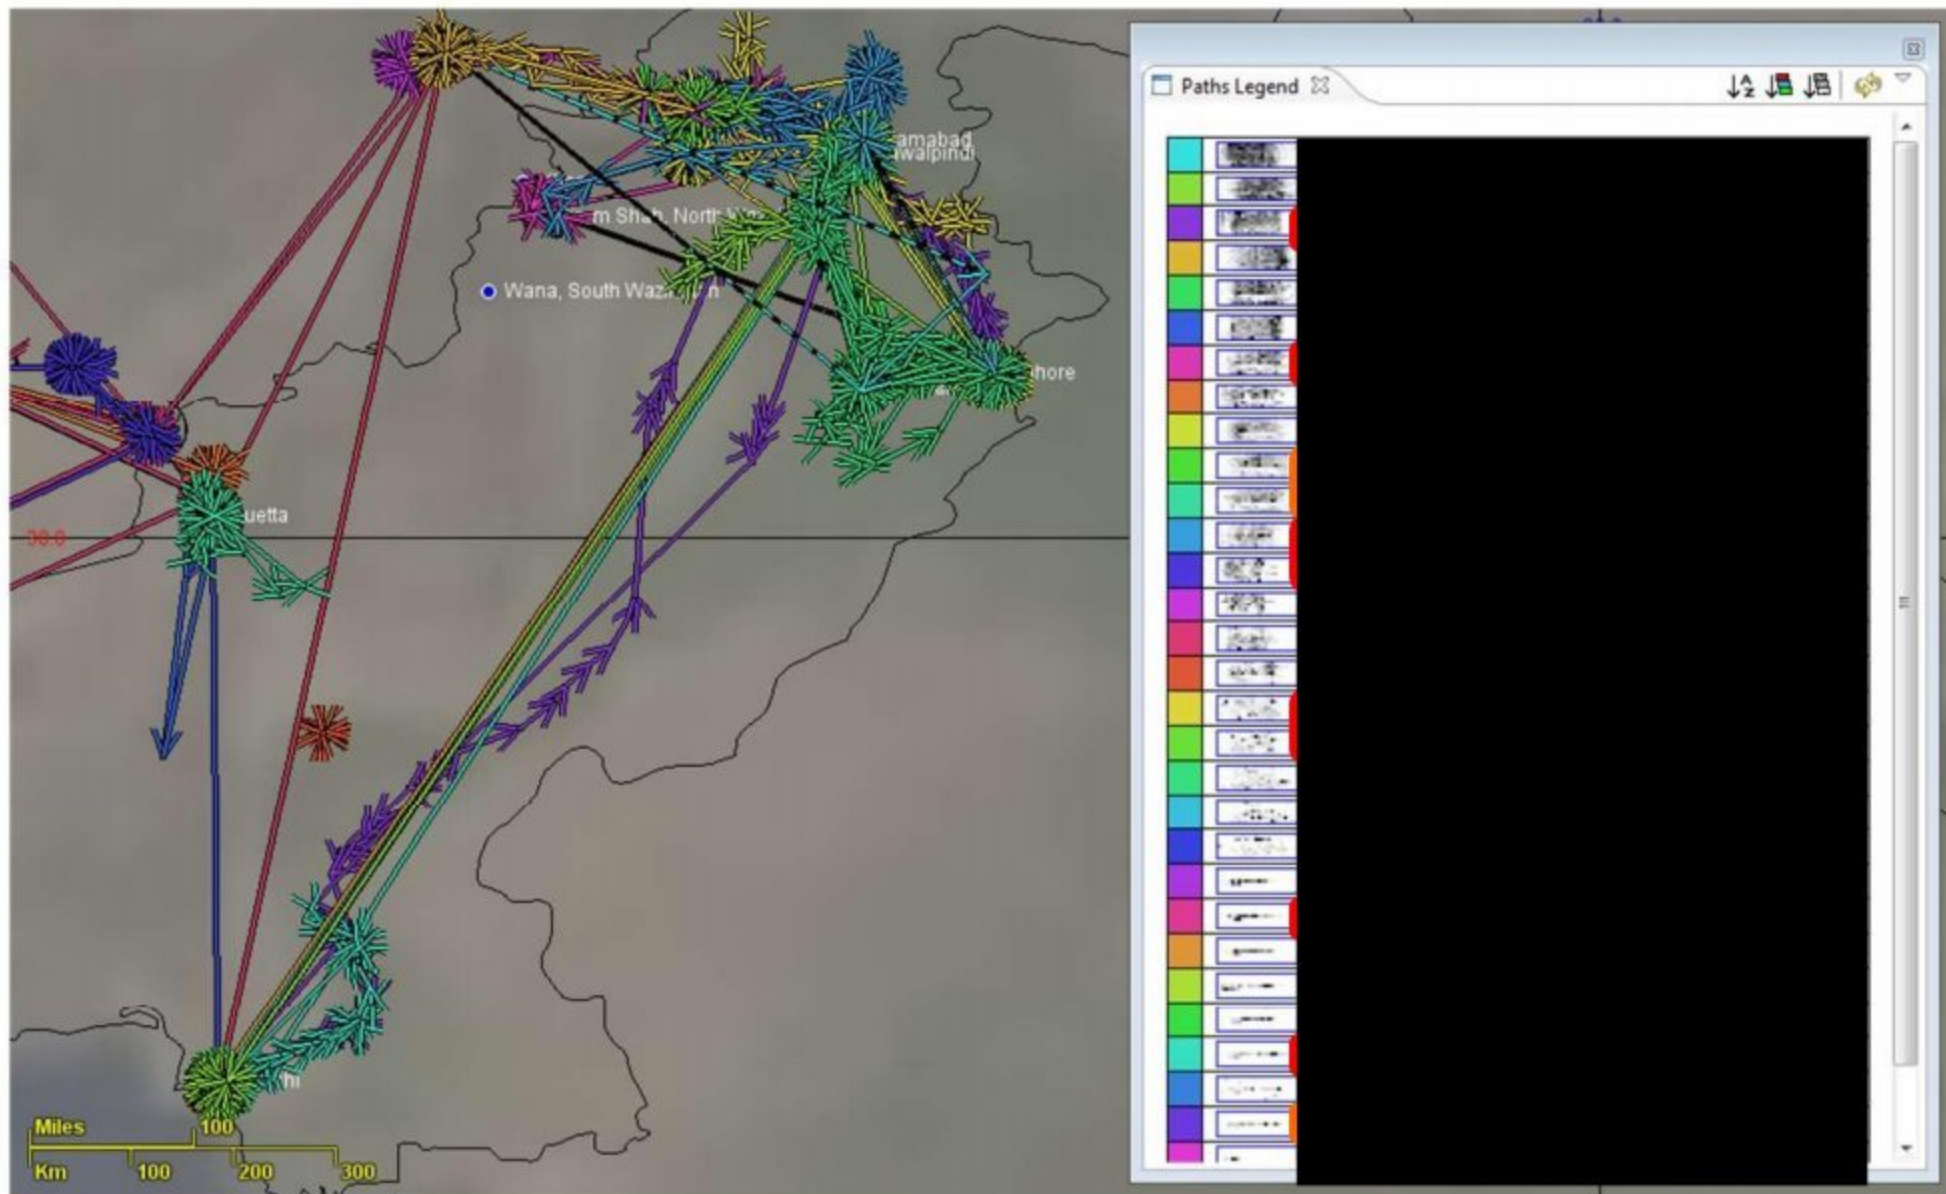

PROB AHMED MUWAFAK ZAIDAN

**TIDE Person Number:** [REDACTED]

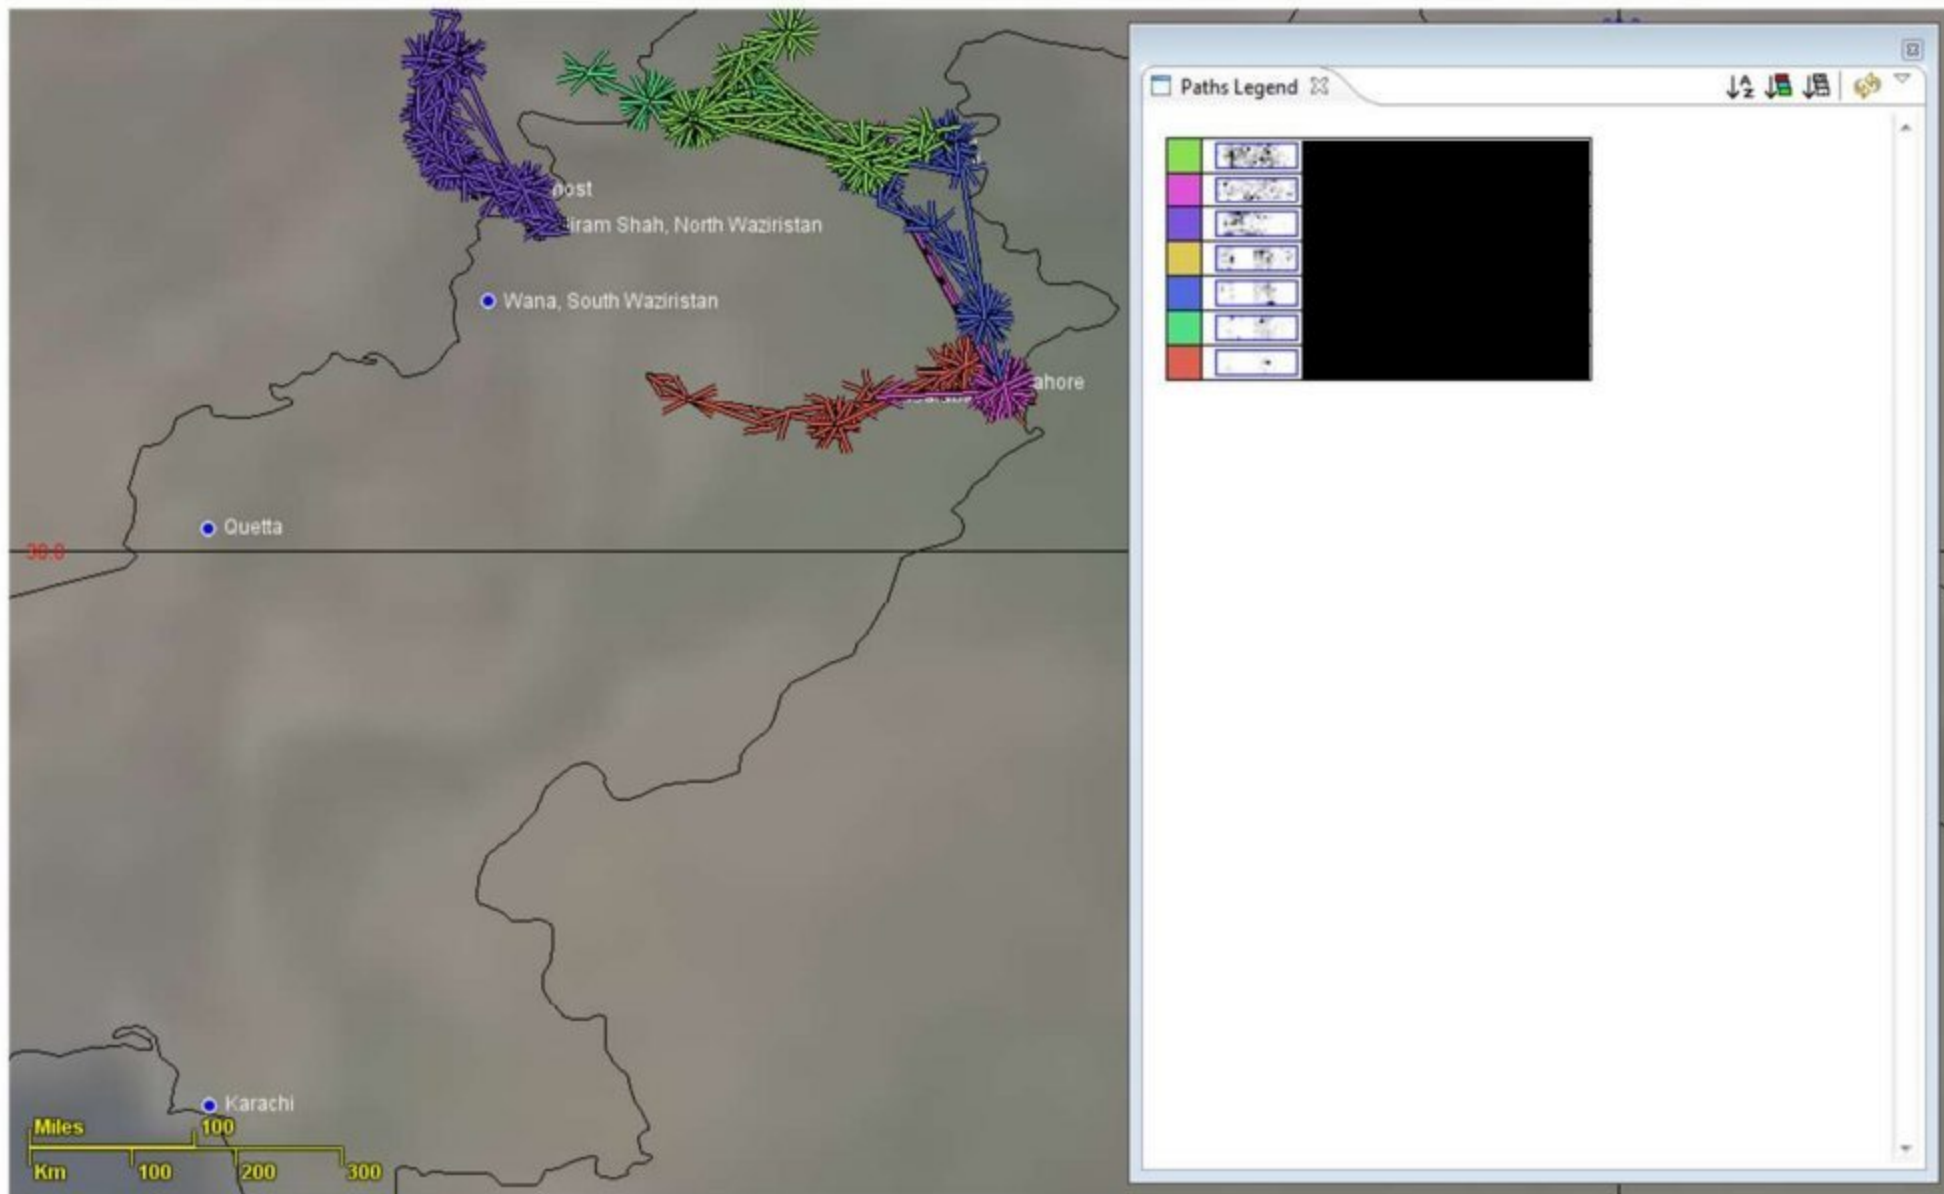

- MEMBER OF AL-QA'IDA
- MEMBER OF MUSLIM BROTHERHOOD
- WORKS FOR AL JAZEERA

**In the top 500 scoring selectors, 21 are tasked leading us to believe that we're on the right track**

# We have also discovered many untasked selectors with interesting travel patterns

# Preliminary results indicate that we're on the right track, but much remains to be done

## Cross Validation Experiment:

- Random Forest classifier operating at 0.18% false alarm rate at 50% miss
- Enhancing training data with Anchory selectors reduced that to 0.008%
- Mean Reciprocal Rank is ~1/10

## Preliminary SIGINT Findings:

- Behavioral features helped discover similar selectors with “courier-like” travel patterns
- High number of tasked selectors at the top is hopefully indicative of the detector performing well “in the wild”
